No. 1974/Eel 2

A copy of the marginally* noted letter, with enclosure, is forwarded to the Secretary to the Government of H. H. the Maharaja of Mysore, with the request that the Hon'ble the Resident may kindly be informed of the views of the Chief in the matter.

*No. 103 D/18 dated 1-3-18 from the Collector of Salem

First Assistant Resident.

AVR

R. O. 178—R. P. B.—10-1917.—500.

Letter No. 103/P.D. dated 1st March 1918, from the Collector of Salem, to the Hon'ble Resident, Mysore.

-----O----

I have the honour to transmit a copy of the letter No.26/p.D. dated 19-2-1918 of Sub Collector, Hosur and a copy of the note relating to rat destruction referred to therein. I shall be glad if any means can be suggested to secure the co-operation referred to by the Sub-Collector.

~~P.N.S/2-3-1918.~~

Copy to the Sub-Collector, Hosur with reference to his letter No.26/P.D. dated 19-2-1918.

--:O:--

Copy of letter No.26/P.D. of 18 dated 19-2-1918 from the Sub-Collector, Hosur to the Collector of Salem.

--:O:--

With reference to your endorsement No.60/P.D. dated 4-2-1918, communicating the note on recent research in anti plague measures, I have the honour to submit the following remarks.

The note shows the value of ascertaining the localities in which plague infection is likely to survive the hot weather and of concentrating rat-trapping operations on such localities. The main difficulty in carrying out the suggestions in the Hosur Taluk is that the localities where plague infection persists are mostly in Mysore territory where the special Plague Officer has no autho-

authority. I therefore submit for your consideration the desirability of addressing the Mysore Government on the point and endeavouring to establish some sort of co-operation between their efforts and ours.

---O---

NOTE ON RECENT RESEARCH IN ANTI-PLAGUE MEASURES BY MAJOR J. C. G. KUNHARDT., I.M.S., AND ASSISTANT SURGEON G. D. CHITRE, L. M. & S.

Research has shown recently that plague infection may persist, through the off-season, in any town or village irrespective of size, situation, etc., but that this usually occurs in only a small proportion of the total number of places infected in any one season. In the great majority of places infection dies out completely before or during the subsequent off-plague season.

It appears that the persistence of infection in these few villages depends chiefly on the presence, during the off-season, of a sufficient number of susceptible rats in that town or village. This again depends chiefly on two factors, viz., the size of the town or village and the season when infection was first introduced. In a large town or village, or one in which infection is introduced comparatively late in the plague season, a number of rats would still be present, sufficient to enable a rat epizootic to smoulder on during that otherwise unfavourable season. Conversely in a small town or village or one into which infection has been introduced sufficiently early in the plague season the rat population become so reduced, by the time the off-season arrives, that infection dies out completely, presumably because the few susceptible rats then surviving are so scattered that it is difficult or impossible for infected fleas to perpetuate the epizootic by passing

passing from one rat to another.

It was suggested that in the few villages in which infection was liable to persist throughout the off-season, and which could readily be detected with a little practice and with the aid of certain 'charts,' natural events might be anticipated by a further reduction in the rat population by poisoning, &c. and that in an average year, it might thus be possible to eradicate the infection completely from any district.

An elaborate experiment was carried out in Poona and the three adjacent districts extending over two years to ascertain if this could be done. The results showed that we were successful in detecting, by our methods, practically all the villages that were likely to carry over each off-season. Also that the epidemics of plague in each successive season were far more dependent on these plague foci within the experimental area than on the importation of infection from without. We were, nevertheless, quite unsuccessful in eradicating plague from the area during the two off-seasons, presumably because the methods of rat destruction hitherto largely employed in India and elsewhere on which we had relied, were of little value.

Experiments were then carried out to ascertain if the methods of rat destruction could be improved. These observations are as yet incomplete, but they show that certain alterations and adjustments in rat traps, particularly a certain increase in the size of the entrance trap, influence considerably the number of rats that can be caught in them.

Attempts at improving the poison baits are even more encouraging. The bait most commonly used, hitherto, throughout the world

17)

world consists of a mixture of phosphorus, sugar and wheat flour. It has been shown that, with Poona rats (Mus rattus) barium carbonate is far more attractive then the phosphorus mixture used in India, it is also about twice as lethal and kills in a shorter time. The addition of sugar is not only a needless extravagance, but its use actually dimirishes the attractiveness of the bait by about 50 per cent. Finally bajri flour is not only cheaper, but is also far more attractive than wheat flour.

Some of the more important results hitherto obtained in a large series of experiments may be summarized in the following tables:-

Baits used.	Number set	Number taken	Percentage taken.
Barium carbonate baits	282	171	60.6
Phosphorus baits ..	282	61	21.6
Control baits (no poison)	282	155	55.0

In Laboratory --

	Material used	Offered (Grains)	Taken (Grains)	Percentage
1.	Barium Carbonate baits	4,500	3,920.7	87.1
	Punjab rat-exterminator baits	4,500	245.1	5.4
2.	Bajri grain ..	5,400	2,806	52.0
	Wheat grain ..	5,400	465	8.6
3.	Barium Carbonate and bajri baits ..	4,500	1,628.7	36.2
	Pure bajri baits (control)	4,500	1,506.3	33.6
4.	Punjab rat-exterminator and bajri baits ..	4,500	227.1	5.1
	Pure bajri baits (control)	4,500	3,661.8	81.4
5.	Baits without sugar	4,500	3,060.2	68.0
	Baits with sugar ..	4,500	1,475.3	32.8
6.	New 'improved' baits	4,500	2,923.2	65.0
	Old 'Punjab rat-exterminator' baits ..	4,500	15.0	0.3

Note.-- Number of rats used in each experiment was 150. i.e, 15 batches of 10 rats ineach.

The new bait therefore appears to be over 200 times more attractive for Poona rats (Mus rattus) than the old bait used

(18

used in our anti-plague experiment. Other results of the experiment suggest also that rats from different localities prefer the kind of grain most commonly grown in each locality. They also show that baits as they are at present made deteriorates rapidly in value after the second day, and that something should be devised to preserve their attractiveness.

Experiments are being continued with a view of further improving the methods of rat destruction in general, and the improvement of poison baits in particular.

Bombay Bacteriological Laboratory.

Parel, 22nd December 1917.

D. No.69/S., dated 10th January 1918.

Communicated for information in continuation of G.O.No. 235.P., dated 12th May 1917. In carrying out rat-destruction work as an anti-plague measure, the instructions contained in the 'Note' may be borne in mind and given effect to in future as far as possible.

W. A. Justice, Major, I.M.S.,
Sanitary Commissioner for
Madras.

Office of the Sanitary Commissioner
with the Government of His Highness
the Maharaja of Mysore,

Dated, Bangalore, 30. 3. 1918.

From

M. Srinivasa Rau Esquire., M.A., M.D., B. SC., (Edin)
D. P. H., (Cantab) & F. C. S., (London.)
Sanitary Commissioner with the Government of His Highness the Maharaja of Mysore, Bangalore.

To

C. S. Balasundaram Iyer, Esq., B.A.,

Chief *Secretary to the Government of H s Highness the Maharaja of Mysore,* Department,

BANGALORE.

Sir,

I have the honor to reply to your letter No. 5253/Sany. 108-17-2 dated the 21st March 1918.

5783

I am quite aware of the importance of adopting a campaign against rats during the off-plague season. It is still in an experimental stage as the note on "Recent research in Anti-plague measures" admits. I am also aware that in the year 1917, plague persisted in 6 border villages in Anekal Taluk during the off-season. Knowing that the initiation of a campaign against rats in a number of villages far apart from each other, is attended with practical difficulties, I proposed to the Government that an experiment of this kind was more likely to succeed in a compact town like Nanjangud and solicited immediate orders in my letter No. G.C.393 dated the 8th March 1918. Not knowing in how many villages of Hosur Taluk plague persisted in the off-season of 1917, I am unable to say how far the Sub-Collector of Hosur is justified in assuming that " the localities where plague infection persists are mostly in Mysore Territory". However

(12

I am not prepared at present, to recommend the starting of a campaign against rats in the villages of Anekal Taluk, but would prefer to wait for the results of the proposed experiment at Nanjangud.

In the meantime, I would suggest the desirability of finding out from the Sub-Collector of Hosur, what the exact nature of "the some sort of cooperation" that he expects from us, is.

I have the honor to be,

Sir,

Your most obedient servant,

M Srinivasa Rao

Sanitary Commissioner.

W Pol № 963 & 22-4-1918

To Jno 32-17 San 108-17-24 (19

The First Assistant to the Hon'ble the
Resident in Mysore.

Sir,

With reference to your memo No.1974 dated the 14th March 1918, forwarding copy of letter from the Collector of Salem and requesting the views of the Durbar in the matter of co-operation for preventing the spread of plague infection by rat-trapping operations in the taluks bordering on Hosur, I am directed to state that the Durbar would be glad if information were furnished as to the basis on which the Sub-Collector states that the localities where plague infection persists are mostly in Mysore territory.

The Durbar are quite aware of the importance of adopting a campaign against rats during the off-season and it is proposed to try it in the first instance in a compact town like Nanjangud as an experimental measure and to extend it to other parts of the State after the results of the experiment are ascertained. As the initiation of a campaign in a number of villages far apart from each other is said to be attended with practical difficulties, I am to state that the Durbar would prefer to wait for the results of the experiment at Nanjangud, before extending the campaign to a number of villages on a large scale.

In the meantime, I am to enquire what the exact nature of the co-operation is, that is expected by the Salem Sub-Collector from the Durbar.

I have &c.

Chief Secretary to Government.

Letter No. 385 P, dated the 30th September 1918, from the Acting Secretary to the Government of Madras, Local and Municipal (Plague) Department, to the Hon'ble the Resident in Mysore.

---:0:---

In reply to your letter No. 3387, dated the 11th May 1918, I am directed to inform you that the Sub Collector referred to the note on recent research in anti-plague measures by Major Kunhardt, a copy of which was attached to his letter, and pointed out to the Collector that little good could be expected from measures taken in the Hosur Taluk in the direction indicated unless similar measures were taken in the villages on the Mysore side of the boundary, from which plague infection frequently spreads to the Hosur taluk. The note quoted suggests that the places selected for a campaign against rats should be selected not because they are compact, or for any other (1) reason, but because they have been infected, or have retained infection, late in the season.

The Sub Collector complains, however, that the local authorities in Mysore seldom send the British authorities early information when (2) a village near the border becomes infected. Co-operation in this x y respect was promised by the Durbar in their communication No.Pol.291, dated 22nd September 1917.

Chief Secretary to the Government
of Mysore, Bangalore.

Sir,

With reference to your letter No.G. 10901-2 San 108-17-6 dated the 10th December 1918 enquiring whether the orders of Government in regard to the sending of immediate intimation to the Tahsildars of the adjoining taluks of the Madras Presidency on the outbreak of plague in a village within a radius of 5 miles of the frontier are duly carried out, I have the honour to state that on enquiry it is learnt that prompt intimation is being sent to the Tasildars concerned. Reports received from the Amildars of Bowringpet, Goribidnur and Malur taluks in this connection are herewith submitted in original.

2. Information from the Amildars of Srinivaspur and Mulbagal taluks has not been received and a further communication will be sent to you as soon as it is received.

I have the honour to be,
Sir,
Your most obedient servant,

B. Venkoba Rao

Local authorities in Mysore seldom send information when a village near the border becomes infected. I am directed to state that the Dy Commissioners of Bangalore & Kolar request that the Amildars of the bordering taluks are sending prompt intimation to the Amildars concerned in accordance with the instructions issued to them on the subject.

Whenever Plague breaks out in villages within a radius of 5 miles from the frontier

I am also to The Dy. Commissioners, Bangalore further report that a copy of the daily plague report of the Dt is being forwarded to the Lt Collector of Hosur.

Report No. 662 dated 24th February 1919, submitted to the Deputy Commissioner, Kolar District, by the Amildar of Mulbagal Taluk.

As per instructions conveyed in Government Order No. 1129-P dated 26th November 1900, necessary information is being given from time to time to the Thasildars of the bordering British Taluks whenever outbreaks of Plague or Cholera occurs in the villages of this Taluk situated within a distance of 5 miles from the British Frontier.

" C o p y "

DC Subbarayappa.

For Deputy Commissioner,

Kolar District.

Letter No. L.F. 278 dated 21st February 1919, from the Amildar of Srinivasapur Taluk, to the Deputy Commissioner, Kolar District.

With reference to your memo No. L.F.C. 1020/18-19, dated 14th December 1918, I beg to state that till recently there was no outbreak of Plague within 5 miles of British Frontier and hence there was no necessity for ~~information~~ intimation being given ; but recently Plague having broken out in Pulgurkote within 5 miles of Madras Presidency Frontier, intimation was duly given in this Office Nos. C.44 dated 17-1-1919 to the Thasildars of Madanapalli and Punganoor.

The Circular order on the subject ~~o~~ is carefully borne in mind.
